

Air Quality Assessment – Roads Farmhouse replacement fire doors

Following the guidelines in the 'Air Quality and Emissions Mitigation – Guidance for Developers (June 2017)' document we have assessed the proposed development against the *Screening checklist* and the *Air quality and emission mitigation assessment checklist*.

Under the *Screening checklist* this development scores as a 'minor' development due to the simplicity of the development, the lack of any significant pollutants, emissions, traffic etc. No change in air quality has been identified either during or post installation, therefore the Air Quality Assessment need only consider exposure.

A review of the products and installation has identified no concerns in terms of emissions and therefore we have considered air quality and do not consider there is mitigation that can be implemented as part of this development.
